

Why do we need scientists?

To the Editor,

Scientists are a really important part of our society because they invent new inventions all the time. Those inventions are important for all of us because they make our lives much easier. There are many scientists who have invented significant inventions, one of them being the light bulb, which was invented by Thomas Alva Edison.

However, Edison wasn't the first one who came up with the idea for an electric light bulb. Several people had come up with the same idea as Edison, but usually the honor is given to him because he was the first one who developed a light bulb that worked and was able to burn longer than the previous ones. Edison tried several filaments before he found the right one. Light bulbs helped a lot in factories and because there was light in there, people were able to work longer. Light bulbs were one of the things which made the industrialization possible.

In addition to light bulbs, medical science has developed a lot over the years due to scientists, but there are still diseases like cancer that we haven't found a cure for. Researchers are working on it, but still it feels almost unreal that the cure hasn't been found yet because scientists have come up with amazing different kinds of medical methods, like vaccination and cures for diseases. A large number of people die because of cancer, the least we can do is to donate money for organizations that help in cancer researches. We also have to support those who have cancer, support their families and loved ones.

Student's Name, Haapajärvi
