

“Fun with food”

POKE College owns 264 acres (107 hectares) of land, which are actively used for growing crops.

Wheat, oats, barley and rye are the grains that are grown, and these go towards the consumption of humans and animals alike. We also produce plenty of hay and silage for our animals. Some other types of vegetation may be experimented with, for example maize and willow.

Our job is to take earth samples, which gives us information such as what fertilizers to use, and to sow or plant seeds. We have a variety of tractors for our assistance and get efficient lessons in operating them.
